DIGITAL LITERACY

Brief overview

In this project I am as the newly appointed **Student Digital Ambassador**, I am tasked with spearheading a digital literacy initiative for my college. The core of this project involves building a comprehensive **Digital Literacy Portfolio** hosted on GitHub, designed to serve as both a professional showcase for the faculty committee and a practical resource for my peers.

The project is structured around five key modules: professional identity, digital safety, responsible communication, information literacy, and content creation. By utilizing free, browser-based tools, I will demonstrate that navigating the digital world effectively does not require a background in computer science, but rather a foundation of intentionality and awareness.

The final deliverable consists of a curated repository and a formal project report. This report will document my technical process, observations on current student digital habits, and reflections on how these skills foster a safer, more professional campus community.

Task 1 report

– Digital Literacy Awareness Infographic

For this task, I used Canva to create a one-page visual resource aimed at improving digital literacy among my batchmates. I chose Canva because its intuitive interface and layout tools allowed me to create a professional-looking "hub-and-spoke" design that clearly connects different digital skills.

My infographic covers four essential areas: What is Digital Literacy, Useful Digital Tools, Safe Internet Practices, and Professional Email Etiquette. In the center, I used a circular diagram to show that these concepts are interconnected. For the content, I highlighted the importance of critical thinking, listed specific tools like LinkedIn and Google Workspace, and provided actionable tips for online safety, such as using Two-Factor Authentication (2FA). I also included a section on email etiquette to ensure students maintain a respectful tone in professional settings.

One thing I found interesting was the challenge of condensing complex information into short, punchy bullet points. I realized that for an infographic to be effective, I had to prioritize clarity over depth to ensure my message was scannable. It was satisfying to see how using color-coded categories could make the information feel much less overwhelming for a student reader.

Task 2 report

For this task 2 , I have chosen to establish my professional presence on **GitHub, LinkedIn, and Kaggle**. As a student specializing in **Artificial Intelligence and Machine Learning (AIML)**, these platforms serve as the core pillars of my technical identity.

GitHub is my primary workspace for version control and code hosting. It allows me to showcase my programming logic and collaborative skills through a public repository. **LinkedIn** acts as my professional bridge to the industry, where I can network with AI researchers and track internship opportunities. Finally, I chose **Kaggle** because it is the industry standard for data science competitions and provides access to vast datasets that are essential for training and testing ML models.

Over the next four years, I plan to use these platforms as a roadmap of my growth. I will use GitHub to document my semester projects and open-source contributions. On Kaggle, I intend to participate in global challenges to refine my predictive modeling skills. Lastly, I will maintain an active LinkedIn profile to share my academic milestones and certifications, ensuring that by graduation, I have a strong, data-backed portfolio that demonstrates my readiness for the AIML field.

Task 3

For this task 3- B , I utilized the **Google Workspace ecosystem**, specifically **Google Forms** and **Google Sheets**. I built a "Digital Literacy Awareness Quiz" to practice data collection and cloud-based collaboration. By linking the form to a live Google Sheet, I practiced real-time data management, ensuring that responses are automatically organized and ready for analysis.

These tools will be immensely helpful in my academic journey, especially within my **B.Tech AIML** studies. Google Workspace allows for seamless collaboration on group projects, where multiple people can edit code documentation or research papers simultaneously. Furthermore, the ability to create surveys and automatically export data into Sheets is a foundational skill for data collection in Machine Learning projects. Being able to efficiently gather, clean, and organize user data or experimental results using these cloud tools will save time and improve the accuracy of my research. Mastering these collaborative platforms

ensures that I can work effectively in both academic teams and future professional environments where remote, cloud-based coordination is the standard.

Task 4 report

Project Report task 4 : Analysis of Poor Digital Communication

Case Study: The Social Media PR Crisis

In a hypothetical scenario, a retail company's social media manager misinterpreted a trending hashtag intended for a serious social justice movement as a lighthearted fashion trend. They posted a promotional tweet: *"Step out in style with our new collection! #MovementForChange."* The public immediately viewed the post as insensitive and exploitative. Within hours, the brand faced a massive boycott, thousands of negative comments, and a **15% drop** in engagement as the post went viral for all the wrong reasons.

What could have been done differently: This crisis was entirely avoidable with better **digital literacy** and **collaborative oversight**.

- **Research Protocols:** The manager should have researched the hashtag's origin before using it for marketing.
- **Approval Workflows:** Implementing a "two-set-of-eyes" policy for all outgoing public communications would have caught the error.
- **Crisis Response:** Instead of deleting the post silently, a transparent apology acknowledging the lack of research would have helped rebuild trust more effectively.

Task 5

While researching cybercrime in India, what surprised me most was the sheer volume of "UPI Collect" scams targeting young adults. I previously assumed only the elderly were vulnerable to tech-related fraud, but seeing how sophisticated "social engineering" has become—where scammers pose as HR recruiters or college officials—was eye-opening. It made me realize that technical knowledge doesn't make one immune to psychological manipulation.

As a result, the one habit I will personally change is my use of public Wi-Fi. I used to connect to any available open network in cafes or libraries to save mobile data without a second thought. Moving forward, I will only use my personal hotspot for sensitive tasks like logging into my bank account or student portal, ensuring my data isn't being intercepted on an unencrypted public connection.
